Humberto Hernandez

Field Engineering | Systems Integration | Technical Operations

Pomona, California | linkedin.com/in/humbertohernandez1220 | github.com/WiFiCowboy

Professional Summary

Field-first network engineer and military veteran with 19 years at AT&T across frontline management, operational development, and OSP engineering. Connect field conditions, technical requirements, and responsibility boundaries to produce clear engineering handoffs. Combine infrastructure experience with software engineering training and human-directed AI workflows to reconcile information, expose gaps, and support execution. Bring that foundation to deployment, systems integration, and technical operations.

Core Capabilities

Field engineering • Systems integration • Network infrastructure • OSP design • Fiber routing • Cellular infrastructure • Construction readiness • Technical documentation • Process standardization • Team development

Professional Experience

Sr Specialist Network Engineer

AT&T | Orange County, California | December 2021–Present

- Connect field conditions, OSP design requirements, and construction needs; identify dependencies and responsibility boundaries to build clear engineering handoffs.
- Assess site access, existing infrastructure, equipment placement, and grounding. Coordinate fiber routing and cellular infrastructure design updates as requirements and site conditions change.
- Develop site-walk packages, process job aids, and engineering guidance that clarify technical requirements and handoff responsibilities.
- Develop and use human-directed Microsoft 365 Copilot workflows with task-specific sessions and execution playbooks that define scope, inputs, review steps, and handoffs.
- Preserve project context and decision history; reconcile working notes and AI output with source documents and maintain validated tracking records. Apply engineering judgment and retain responsibility for decisions within assigned scope.

Technology Operations Development Coach

AT&T | Los Angeles County, California | April 2011–December 2021

- Developed managers and frontline personnel by connecting performance data, technical requirements, and field execution conditions.
- Analyzed metrics and operational processes to identify gaps affecting network efficiency, execution quality, and training effectiveness; provided findings to leadership to support coaching priorities and cost-focused decisions.
- Proposed process and training improvements and delivered leader-led training independently and with a team, translating technical processes into practical field guidance.

Network Services Manager

AT&T | Los Angeles County, California | April 2007–April 2011

- Managed frontline field-service personnel supporting U-verse, IPTV, and VoIP operations; aligned technical readiness, performance expectations, and operating standards.
- Trained direct reports, addressed performance gaps, and applied established accountability and disciplinary procedures. Served as an AT&T liaison with union representatives on operational and personnel matters.

Humberto Hernandez

Selected Technical Projects

WHITE RABBIT and FORGE Core

Personal portfolio projects | Python | 2026

github.com/WiFiCowboy/white-rabbit

Built inspectable demonstrations of deployment-readiness assessment and bounded mission coordination using synthetic local records. Directed the scope, reviewed the implementation and documentation, and ran validation on a personal Mac. Used AI assistance for architecture, code, tests, and documentation.

WHITE RABBIT

- Evaluates power, connectivity, and access evidence; preserves missing and conflicting observations and validates source references before reporting readiness.
- Allows at most one supplemental lookup when permitted, then produces a structured JSON result and Markdown report without taking deployment action.

FORGE Core

- Accepts a mission brief, checks the executor identity and input snapshots, dispatches once with a five-second timeout, and reconciles the returned result against the mission and evidence.
- Separates completed execution from mission readiness. A missing-connectivity walkthrough completed and reconciled correctly while retaining a blocked mission and a pending human decision.
- Validated both components with 31 passing unit tests on macOS (Unix). Tests cover missing and conflicting evidence, forged references, input changes, dispatch limits, executor failures, and timeouts.

Technical Tools and Training

Engineering and operations: Microsoft 365 Copilot, Excel, OneNote, Teams, SharePoint, and technical documentation workflows.

Demonstrated in portfolio projects: Python, JSON, Git, GitHub, command-line validation, unit testing, and Markdown documentation.

Software engineering training: Full-stack web development covering frontend and backend development, JavaScript, Node.js, React, Redux, algorithms, and data structures.

Education

Thinkful

Software Engineering training completed | October 2019–June 2020

Udacity

Intro to Programming Nanodegree | Completed 2018

Credential and Military Background

FCC General Radiotelephone Operator License (GROL)

Military veteran with prior technical service in the U.S. Navy, U.S. Air Force, and U.S. Army Reserve.
